Enhancement incentive system using an employee action generating an improved wage on a distributed network.

- 11. A system using an employee action to generate an earning, comprising:
  - a. plurality of client computers connected to a network, upon which an employee identification profile is entered and transmitted to a server computer;
  - b. a server computer connected to the network, which performs the steps of:

    receiving the employee identification profile;

    generating points based upon an employee action;

    exchanging points between employees; and

    updating the employee identification profile based upon the action,

    earning or point conversion
- 12. The system of claim 1, which performs the steps further:

Converting points to employee units where each unit has value and the employee selects from the group of equity, cash, product and services; Selling or purchasing points.

13. The system of claim 1, which performs the steps further:

a work shift has a point value;
exchanging work shifts having point value, which the employee can offer

14. The system of claim 1, which performs the steps further:

customer identification profile;

points in exchange.

providing employee assignment of customers;

recording customer preference, request and frequency;

stores the assignment, action, request, frequency in a database.
